

AI Support Assistant.

An assistant that answers questions from your own documents, gives a source for every answer, and hands off to a person when it should. Grounded and checkable, not a generic chatbot.

Question

YOUR DOCS

THE PROBLEM

Slow by hand, or a bot you cannot trust.

Every business answers the same handful of questions over and over. Customers ask about pricing, what areas you cover, how long a job takes, what a service includes. Staff type out the same replies all day, or people wait hours for an answer that already lives in a document nobody wants to dig through.

The obvious fix is a chatbot, and that is where most businesses get burned. A generic bot will confidently invent a price or a policy that does not exist, and one wrong answer to a customer is worse than a slow one. So people give up on it and go back to answering by hand.

WHAT I BUILT

It answers from your content, or it hands off.

You give it your manuals, FAQs, policies, product docs and past replies, and it uses only those to answer. Every answer points back to the source it came from, so anyone can check it. And when it does not have a good answer, it says so and passes the conversation to a person instead of guessing.

THE WHOLE POINT

Answers from your content, with a source. Or it hands off.

It does not make things up. That single rule is what turns a chatbot from a liability into something you can put in front of a customer.

WHERE IT LIVES

Website widget

For customers

Support inbox

Email auto-reply

Slack / Teams

For your team

One knowledge base behind all of them, so an answer is the same wherever it is asked.

HOW IT WORKS

From your documents to a grounded answer.

1

Your content goes in

Manuals, FAQs, policies, help articles and past replies, whatever holds the answers.

2

It gets organised

The content is broken into pieces and indexed, so the system can find the right passage for any question in an instant.

3

A question comes in

From a customer on your website, an email to your support inbox, or a team member in Slack.

4

It finds the relevant passages

It pulls the specific pieces of your content that relate to the question, not the whole library.

5

It answers, or it hands off

✓ FOUND IT

Writes the answer from what it retrieved, in your tone, with the source attached.

! NOTHING SOLID

If it cannot answer from your content, it says so rather than guessing.

6

A person picks up when needed

Out of scope, low confidence, or the customer asks for a human. The conversation is passed on with the full context, not a cold start.

A WORKED EXAMPLE

A real answer, and an honest "I do not know".

Here is the assistant answering a question grounded in the business's own coverage document, and then being honest when a question falls outside what it can answer.

Q Do you cover rewiring in a rented flat, or only owner-occupied homes?

A Yes. We carry out full and partial rewiring in rented properties as well as owner-occupied homes. For rentals we arrange access and sign-off directly with the landlord or letting agent.

 **Source: Services and coverage, page 2**

Q Can you take on a job in France next month?

A That is outside what I can answer from our documents, so I am passing you to the team.

 **Handed to a person**

Showing both matters. The grounded answer proves it is useful, and the clean handoff proves it will not embarrass you when it reaches the edge of what it knows.

WHAT MAKES IT TRUSTWORTHY

Grounded, cited, and honest about its limits.

It only uses your content

Nothing is pulled from the open internet, so nothing comes back off-brand or wrong.

Every answer has a source

Anyone can see which document it came from and check it.

It refuses rather than guesses

No confident made-up answers, the thing that sinks most chatbots.

It hands off cleanly

A person picks up with the full conversation, not a cold start.

It stays current

Update a document and the answers update with it, no retraining.

It sounds like you

Replies follow your tone, not a generic script.

UNDER THE HOOD

There is real engineering behind it. Your content is broken into passages and turned into embeddings held in a vector database, so the right passage can be retrieved for any question. Retrieval runs first, then Anthropic's Claude writes the answer using only what was retrieved, with the source attached. Confidence and scope checks decide when to hand off, and the whole thing plugs into a website widget, a support inbox, or your team's chat.

WHY THIS BEATS A GENERIC CHATBOT

It retrieves first, then answers.

GENERIC CHATBOT

Answers from anything it was trained on
Can invent prices and policies
No source to check
Sounds confident even when wrong

THIS ASSISTANT

Answers only from your content
Cites the source every time
Hands off when it is unsure
Refuses rather than guesses

THE RESULTS

RESPONSE TIME

Instant

Answered the moment it is asked, at any hour.

MADE-UP ANSWERS

Zero

It cites a source or it hands off.

YOUR TEAM

Freed up

Left to handle the genuinely tricky cases.

Figures shown are representative of the system's design and typical impact. Replace with your own measured results before publishing.

What I can build for you

If your team answers the same questions all day, or you have a pile of documents nobody reads, I can build an assistant that answers from them, cites its sources, and knows when to pass things to a person. On your website, in your inbox, or inside your team's chat, all from one knowledge base you control.
